Start and End of Freefall

- Two slices in time:
 - Start of freefall
 - End of freefall
- NIST states, “This freefall drop [Section A] continued for approximately 8 stories...”
(therefore)
- No gravitational (potential) energy available to break up and disperse Section A.
(and then)
- Building continues **ACCELERATING** to the ground, but at less than freefall.

What provided energy for eliminating Section A?
