Why

are Architects and Engineers re-examining the destruction of the World Trade Center?

The shock from the staggering loss of life and destruction on 9/11 left most of us relying upon analyses offered by pre-selected "experts" with conflicts of interest.

Since 2001 we have had time to emerge from the hypnotic trance of the trauma and begin to rationally assess the scientific forensic evidence. This evaluation casts grave doubt upon the media stories and the official reports by the 9/11 Commission, FEMA, and NIST (National Institute of Standards and Technology).

We hope you will find the courage to review this evidence thoroughly.

At AE911Truth.org you will find a convincing case that the 3 World Trade Center high-rise buildings were destroyed by classic as well as new forms of explosive controlled demolitions.

4 to 20-ton steel column/beam sections were severed at their connections and hurled into the sides of neighboring buildings two football fields away at 50 mph.

FDNY found several tons of molten metal “flowing like lava” under all 3 high-rises. 1400°F office fires cannot produce 2700+°F molten steel — without thermite incendiaries.

Microspheres formed from molten iron (the byproduct of thermite) were found in the WTC dust by US agencies, environmental firms and independent physicists. Unignited thermite chips have also been discovered.
